2014 ANNUAL SUMMARY REPORT
Cross Connection/Backflow Prevention
Water Systems with 300 or More Connections
Public Health Authority
Drinking Water Services

The Specialist who is responsible for implementing the Cross Connection/Backflow Prevention Program for this water system should complete, sign and date this report. Please type or print clearly. This report is due by March 31, 2015.

1. Address
Please provide the mailing address for cross connection related mail, and the other communication information.

Cross Connection/Backflow Prevention Contact Person

2. Cross Connection Ordinance or Other Enabling Authority
All community water systems with 15 or more connections are required to have a written cross connection ordinance, by-laws, policy or other written enabling authority.

a. Does your water system have a written ordinance (or other enabling authority)? ☐ Yes ☐ No
b. Date of latest revision _______________. Submit a copy of your latest revision with this report only if your current one is not already on file with the Drinking Water Program. Do not submit a written copy every year unless you make changes to it.

3. Certified Cross Connection Specialist
Community water systems serving 300 or more service connections must have a certified Cross Connection Specialist who is responsible for the Cross Connection/Backflow Prevention Program. (OAR 333-061-0073(1)) This is not for people who are Water System Operators or Testers only.

<table>

5. Your Customer Base

Who does your water system serve? This is for everyone in your water system - not just people with backflow assemblies. Check yes or no - do not leave blank. If you check yes for any group, fill in the quantity being as accurate as possible. A connection can only be used once. If someone is a commercial customer and a high hazard – use only as a high hazard. The total of the first three lines should equal the number of connections on the fourth line.

Yes No
☐ ☐ Residential customers. If yes, how many connections? _____________________
☐ ☐ Customers specified in Table 48 of OAR 333-061-0070 Cross Connection Control Requirements. This identifies most high hazards. A copy of this table is on page 4 of this form. If yes, how many? ______________
☐ ☐ How many customers are not residential or listed on Table 48? ____________

This is everyone else - mainly commercial properties and multi-family dwellings.

Number of connections in this system. ______________ If you don’t know, you can go to https://yourwater.oregon.gov and find your system by name or water system ID number.

6. System Questions:

If your system’s written policy does not specifically ban use of a type of assembly, you are allowing its use. Reduced Pressure Backflow Prevention Assemblies are required to be used in “high hazard” situations and you should not deny their use even if you do not have a high hazard situation now. Double Checks are required in the Plumbing code in some situations and you should not deny their use.

Yes No
☐ ☐ a. Are Reduced Pressure Backflow Prevention Assemblies allowed in your system?
☐ ☐ b. Are Double Check Backflow Prevention Assemblies allowed in your system?
☐ ☐ c. Are Pressure Vacuum Breakers allowed in your system?
☐ ☐ d. Are Atmospheric Vacuum Breakers allowed in your system?

7. Written Backflow Prevention Program

All Community Water Systems must have a written Cross Connection/Backflow Prevention Program.

Does your water system have a current:  Yes No
☐ ☐ a. Written Backflow Prevention Program Plan? To satisfy this requirement you must have the following three elements.

Does your program plan include:
☐ ☐ b. A master list of facilities and premises which are subject to testing and those that are not?
☐ ☐ c. On the above master list, do you designate high hazards?
  You could have a separate list or designation of your customers that are high hazards.
☐ ☐ d. Do you keep a current record of yearly testing and take action on missing ones?
8. **Testing**

This refers to tests made by your water system and those made by Oregon Certified Testers and turned into your system from January 1, 2014 thru December 31, 2014. Failures include assemblies that worked properly after being flushed. If a device is tested several times before it passes, that is only one test for our purposes here.

a. How many Backflow Prevention assembly tests were done in 2014?_________
b. How many assemblies or devices initially failed?_________
c. How many of the assemblies or devices from above were corrected and passed a retest?_________
d. If b. and c. are different, please explain.

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1. Total Number of Assemblies in Your System

2. Final Total of Assemblies Passed (Initial & Repaired)
   This is always less than or equal to the number of assemblies

3. Number of Initial Failures of Assemblies

4. Number of Failures Corrected (or Removed)

5. Number of New Installations (Not Replaced Failures)

**KEEP THIS FOR YOUR RECORDS**

* Refer to OAR 333-061-0070(8) Premise Isolation Requirements.
** A Double Check Valve Backflow Prevention Assembly could be used if the water supplier determines there is only a non-health hazard at a beverage bottling plant.
