**333-061-0043 Consumer Confidence Reports**

This rule establishes the minimum requirements for the content of annual reports that community water systems must deliver to their customers. These reports must contain information on the quality of the water delivered by the systems and characterize the risks (if any) from exposure to contaminants detected in the drinking water in an accurate and understandable manner. For the purpose of this rule, customers are defined as billing units or service connections to which water is delivered by a Community Water System.

1. **Delivery deadlines:**
   - (a) Community water systems must deliver their reports by July 1, annually. The report must contain data collected during, or prior to, the previous calendar year;
   - (b) A new community water system must deliver its first report by July 1 of the year after its first full calendar year in operation and annually thereafter;
   - (c) A community water system that sells water to another community water system must deliver the applicable information to the buyer system:
     - (A) No later than April 1, annually; or
     - (B) On a date mutually agreed upon by the seller and the purchaser, and specifically included in a contract between the parties.

2. **Content of the Reports:**
   - (a) Each community water system must provide to its customers an annual report that contains the information specified in sections (2), (3), (4), and (5) of this rule;
   - (b) Each report must identify the source(s) of the water delivered by the community water system by providing information on:
     - (A) The type of water: e.g., surface water, ground water; and
     - (B) The commonly used name (if any) and location of the body (or bodies) of water.
   - (c) If a source water assessment has been completed, the report must notify consumers of the availability of this information and the means to obtain it. In addition, systems are encouraged to highlight in the report significant potential sources of contamination in the drinking water protection area if they have readily available information. Where a system has received a source water assessment from the Authority, the report must include a brief summary of the system's susceptibility to potential sources of contamination, using language provided by the Authority or written by the operator;
   - (d) Each report must contain the following definitions:
     - (A) Maximum Contaminant Level Goal or MCLG: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety;
     - (B) Maximum Contaminant Level or MCL: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
(C) Variance: A system operating under a variance as prescribed in OAR 333-061-0045 must include the following definition in its report:
Variances: State permission not to meet an MCL or a treatment technique under certain conditions;

(D) Treatment Technique or Action Level: A system which has a detection for a contaminant for which EPA has set a treatment technique or an action level must include one or both of the following definitions as applicable:
(i) Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water;
(ii) Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

(E) Maximum Residual Disinfectant Level Goal or MRDLG: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

(F) Maximum Residual Disinfectant Level or MRDL: The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

(3) Detected Contaminants:
(a) The following information must be included in each report for contaminants subject to mandatory monitoring (except Cryptosporidium). Detected means at or above the detection level prescribed by each EPA approved analytical method set forth in 40 CFR 141:
(A) Contaminants and disinfection by-products subject to an MCL, action level, MRDL, or treatment technique (regulated contaminants); and
(B) Unregulated contaminants for which monitoring is required.
(b) The data relating to these contaminants must be displayed in one table or in several adjacent tables. Any additional monitoring results which a community water system chooses to include in its report must be displayed separately.
(c) The data must be derived from data collected to comply with state monitoring and analytical requirements during the calendar year except that where a system is allowed to monitor for regulated contaminants less often than once a year, the table(s) must include the date and results of the most recent sampling and the report must include a brief statement indicating that the data presented in the report are from the most recent testing done in accordance with the regulation. No data older than five years need be included.
(d) For detected regulated contaminants (listed in Table 45 of this rule), the table(s) in the report must contain:
(A) The MCL for that contaminant expressed as a number equal to or greater than 1.0 (as provided in Table 45);

(B) The MCLG for that contaminant expressed in the same units as the MCL;

(C) If there is no MCL for a detected contaminant, the table must indicate that there is a treatment technique, or specify the action level, applicable to that contaminant, and the report must include the definitions for treatment technique and/or action level, as appropriate, specified in paragraph (2)(d)(D) of this rule;

(D) For contaminants subject to an MCL, except turbidity and total coliforms, the highest contaminant level used to determine compliance with OAR 333-061 and the range of detected levels, as follows:

(i) When compliance with the MCL is determined annually or less frequently: the highest detected level at any sampling point and the range of detected levels expressed in the same units as the MCL;

(ii) When compliance with the MCL is determined by calculating a running annual average of all samples taken at a monitoring location: the highest average at any of the monitoring locations and the range of all monitoring locations must be expressed in the same unit of measure as the MCL. For the MCL for TTHM and HAA5 as specified by OAR 333-061-0030(2)(b), water systems must include the highest locational running annual average for TTHM and HAA5 and the range of individual sample results for all monitoring locations expressed in the same unit of measure as the MCL. If more than one location exceeds the MCL for TTHM or HAA5, the water system must include the locational running annual averages for all locations that exceed the MCL;

(iii) When compliance with the MCL is determined on a system wide basis by calculating a running annual average of all samples at all monitoring locations: the average and range of detections must be expressed in the same units as the MCL. The water system is required to include individual sample results for an IDSE conducted in accordance with OAR 333-061-0036(4)(b) of this rule when determining the range of TTHM and HAA5 results to be reported in the annual consumer confidence report for the calendar year that the IDSE samples were taken;

(iv) When rounding of results to determine compliance with the MCL is allowed by the regulations, rounding should be done
prior to multiplying the results by the factor listed in Table 45 of this rule.

Key:
AL = Action Level
GWR = Ground Water Rule
MCL = Maximum Contaminant Level
MCLG = Maximum Contaminant Level Goal
MFL = million fibers per liter
mrem/year = Millirems per year (a measure of the radiation absorbed by the body)
NTU = Nephelometric Turbidity Units
pCi/l = picocuries per liter (a measure of radioactivity)
ppm = parts per million or milligrams/liter (mg/l)
ppb = parts per billion or micrograms/liter (ug/l)
ppt = parts per trillion or nanograms/liter
ppq = parts per quadrillion, or picograms/liter
TT = Treatment Technique

(e) Turbidity:
(A) When it is reported pursuant to OAR 333-061-0030(3)(a), 333-061-0032(2), and 333-061-0036(5)(a): the highest monthly value. The report should include an explanation of the reasons for measuring turbidity. This includes water systems currently without filtration treatment, but required to install filtration through a Notice of Violation and Remedial Order.
(B) When it is reported pursuant to OAR 333-061-0030(3): The highest single measurement and the lowest monthly percentage of samples meeting the turbidity limits specified in OAR 333-061-0030(3) for the filtration technology being used. The report should include an explanation of the reasons for measuring turbidity.

(f) Lead and copper: the 90th percentile value of the most recent round of sampling and the number of sampling sites exceeding the action level and the lead-specific information as prescribed in subsection (4)(c) of this rule.

(g) Total coliform:
(A) The highest monthly number of positive samples for systems collecting fewer than 40 samples per month; or
(B) The highest monthly percentage of positive samples for systems collecting at least 40 samples per month.

(h) Fecal coliform: the total number of positive samples.
(i) The likely source(s) of detected contaminants to the best of the operator's knowledge. Specific information regarding contaminants may be available in sanitary surveys and source water assessments, and should be used when available to the operator. If the operator lacks specific information on the likely source, the report must include one or more of the typical sources for that contaminant listed in Table 46 which are most applicable to the system.
(j) If a community water system distributes water to its customers from multiple hydraulically independent distribution systems that are fed by different raw water sources, the table should contain a separate column for each service area and the report should identify each separate distribution system. Alternatively, systems could produce separate reports tailored to include data for each service area.

(k) The table(s) must clearly identify any data indicating violations of MCLs, MRDLs, or treatment techniques and the report must contain a clear and readily understandable explanation of the violation, the length of the violation, the potential adverse health effects, and actions taken by the system to address the violation. To describe the potential health effects, the system must use the relevant language in Table 46 of this rule.

(l) For detected unregulated contaminants for which monitoring is required (except Cryptosporidium), the table(s) must contain the average and range at which the contaminant was detected. The report may include a brief explanation of the reasons for monitoring for unregulated contaminants.

(m) Information on Cryptosporidium, radon, and other contaminants:
   (A) If the system has performed any monitoring for Cryptosporidium, which indicates that Cryptosporidium may be present in the source water or the finished water, the report must include:
       (i) A summary of the results of the monitoring, and
       (ii) An explanation of the significance of the results.
   (B) If the system has performed any monitoring for radon which indicates that radon may be present in the finished water, the report must include:
       (i) The results of the monitoring; and
       (ii) An explanation of the significance of the results.
   (C) If the system has performed additional monitoring which indicates the presence of other contaminants in the finished water, the system is strongly encouraged to report any results which may indicate a health concern. To determine if results may indicate a health concern, EPA recommends that systems find out if EPA has proposed a National Primary Drinking Water Regulation or issued a health advisory for that contaminant by calling the Safe Drinking Water Hotline (800-426-4791). EPA considers detects above a proposed MCL or health advisory level to indicate possible health concerns. For such contaminants, EPA recommends that the report include:
       (i) The results of the monitoring; and
       (ii) An explanation of the significance of the results noting the existence of a health advisory or a proposed regulation.

Key:
AL=Action Level
MCL=Maximum Contaminant Level
MCLG=Maximum Contaminant Level Goal
MFL=million fibers per liter
mrem/year=millirems per year (a measure of radiation absorbed by the body)
NTU=Nephelometric Turbidity Units
pCi/l=picocuries per liter (a measure of radioactivity)
ppm=parts per million, or milligrams per liter (mg/l)
ppb=parts per billion, or micrograms per liter (ug/l)
ppt=parts per trillion, or nanograms per liter
ppq=parts per quadrillion, or picograms per liter
TT=Treatment Technique

(n) Compliance with OAR 333-061: In addition to subsection (3)(k) of this rule, the report must note any violation that occurred during the year covered by the report of a requirement listed below, and include a clear and readily
understandable explanation of the violation, any potential adverse health effects, and the steps the system has taken to correct the violation.

(A) Monitoring and reporting of compliance data;
(B) Filtration and disinfection prescribed by OAR 333-061-0032: For systems which have failed to install adequate filtration or disinfection equipment or processes which constitutes a violation or have an equipment failure constituting a violation, the report must include the following language as part of the explanation of potential adverse health effects: Inadequately treated water may contain disease-causing organisms. These organisms include bacteria, viruses, and parasites which can cause symptoms such as nausea, cramps, diarrhea, and associated headaches;
(C) Lead and copper control requirements: For systems which fail to take one or more actions prescribed by OAR 333-061-0034 the report must include the applicable language in Table 46 of this rule for lead, copper, or both;
(D) Treatment techniques for Acrylamide and Epichlorohydrin: For systems which violate the requirements of OAR 333-061-0030(7), the report must include the relevant health effects language in Table 46 of this rule.

(E) Recordkeeping of compliance data;
(F) Special monitoring requirements prescribed by OAR 333-061-0036(2)(f) and for unregulated contaminants as required by EPA;
(G) Violation of the terms of a variance, administrative order or judicial order.

(o) Variances: If a system is operating under the terms of a variance as prescribed in OAR 333-061-0045, the report must contain:
(A) An explanation of the reasons for the variance;
(B) The date on which the variance was issued;
(C) A brief status report on the steps the system is taking to install treatment, find alternative sources of water, or otherwise comply with the terms and schedules of the variance; and
(D) A notice of any opportunity for public input in the review, or renewal, of the variance.

(p) Additional information:
(A) The report must contain a brief explanation regarding contaminants which may reasonably be expected to be found in drinking water including bottled water. This explanation may include the language in subparagraphs (3)(p)(A)(i), (ii) and (iii) of this rule, or systems may use their own comparable language. The report also must include the language of subparagraph (3)(p)(A)(iv) of this rule.
(i) The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs,
and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity;

(ii) Contaminants that may be present in source water include:

(I) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife;

(II) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming;

(III) Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses;

(IV) Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems;

(V) Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

(iii) In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health;

(iv) Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

(B) The report must include the telephone number of the owner, operator, or designee of the community water system as a source of additional information concerning the report;

(C) In communities with a large proportion of non-English speaking residents the report must contain information in the appropriate language(s) regarding the importance of the report or contain a telephone number or address where such residents may contact the
system to obtain a translated copy of the report or assistance in the appropriate language;

(D) The report must include information (e.g., time and place of regularly scheduled board meetings) about opportunities for public participation in decisions that may affect the quality of the water;

(E) The systems may include such additional information as they deem necessary for public education consistent with, and not detracting from, the purpose of the report.

(4) Required additional health information:

(a) All reports must prominently display the following language: Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

(b) A system which detects nitrate at levels above 5 mg/l, but does not exceed the MCL:

(A) Must include a short informational statement about the impacts of nitrate on children using language such as: Nitrate in drinking water at levels above 10 mg/l is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant you should ask advice from your health care provider.

(B) May write its own educational statement, but only in consultation with the Authority.

(c) Every report must include the following lead-specific information:

(A) A short informational statement about the lead in drinking water and its effects on children. The statement must include the following information: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. {NAME OF WATER UTILITY} is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have
your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

(B) The water system may write its own educational statement, but only in consultation with the Authority.

(5) Special requirements for groundwater systems:

(a) Any groundwater system that receives notification of a significant deficiency that is not corrected at the time of the next report, or of an *E. coli*-positive groundwater source sample that was not invalidated in accordance OAR 333-061-0036(6)(x) must inform its customers in the next report. The water system must continue to inform the public annually until the Authority determines that the particular significant deficiency is corrected or that the fecal contamination in the groundwater source is addressed in accordance with OAR 333-061-0032(6). Each report must include the following elements:

(A) The nature of the particular significant deficiency or the source of the fecal contamination (if the source is known), and the date the significant deficiency was identified by the Authority or the dates of the *E. coli*-positive groundwater source samples;

(B) If the fecal contamination in the groundwater source has been addressed as prescribed by OAR 333-061-0032(6) and the date of such action;

(C) The Authority-approved plan and schedule for correction, including interim measures, progress to date, and any interim measures completed for any significant deficiency or fecal contamination in the groundwater source that has not been addressed as prescribed by OAR 333-061-0032(6); and

(D) The potential health effects language specified in OAR 333-061-0097(4)(b) if the system received notice of a *E. coli*-positive groundwater source sample that was not invalidated by the Authority in accordance with OAR 333-061-0036(6)(x).

(b) The Authority may require a water system with significant deficiencies that have been corrected before the next report is issued to inform its customers of the significant deficiency, how the deficiency was corrected, and the date of correction in accordance with subsection (5)(a) of this rule.

(6) Report delivery and recordkeeping:

(a) Except as provided in subsection (6)(g) of this rule, each community water system must mail or otherwise directly deliver one copy of the report to each customer.

(b) The system must make a good faith effort to reach consumers who do not get water bills, using means recommended by the Authority. EPA expects that an adequate good faith effort will be tailored to the consumers who are
served by the system but are not bill-paying customers, such as renters or workers. A good faith effort to reach consumers would include a mix of methods appropriate to the particular system such as: Posting the reports on the Internet; mailing to postal patrons in metropolitan areas; advertising the availability of the report in the news media; publication in a local newspaper; posting in public places such as cafeterias or lunch rooms of public buildings; delivery of multiple copies for distribution by singularly-billed customers such as apartment buildings or large private employers; delivery to community organizations.

(c) No later than the date the system is required to distribute the report to its customers, each community water system must mail a copy of the report to the Authority, followed within three months by a certification that the report has been distributed to customers, and that the information is correct and consistent with the compliance monitoring data previously submitted to the Authority.

(d) No later than the date the system is required to distribute the report to its customers, each community water system must deliver the report to any other agency or clearinghouse identified by the Authority.

(e) Each community water system must make its reports available to the public upon request.

(f) Each community water system serving 100,000 or more persons must post its current year's report to a publicly-accessible site on the Internet.

(g) The Governor of a State or his designee, can waive the requirement of subsection (6)(a) of this rule for community water systems serving fewer than 10,000 persons.

(A) Such systems must:

(i) Publish the reports in one or more local newspapers serving the area in which the system is located;

(ii) Inform the customers that the reports will not be mailed, either in the newspapers in which the reports are published or by other means approved by the State; and

(iii) Make the reports available to the public upon request.

(B) Systems serving 500 or fewer persons may forego the requirements of subparagraphs (6)(g)(A)(i) and (ii) of this rule if they provide notice at least once per year to their customers by mail, door-to-door delivery or by posting in an appropriate location that the report is available upon request.

(h) Any system subject to this rule must retain copies of its consumer confidence report for no less than five years.

Stat. Auth.: ORS 448.131
Stats. Implemented: ORS 431.110, 431.150
333-061-0045 Variances

(1) Variances from the maximum contaminant levels may be granted by the Authority to public water systems under the following circumstances where:

(a) An evaluation satisfactory to the Authority indicates that alternative sources of water are not reasonably available to the system;

(b) There will be no unreasonable risk to health;

(c) The water supplier has provided sufficient evidence to confirm that the best available treatment techniques which are generally available are unable to treat the water in question so that it meets maximum contaminant levels;

(d) The water supplier agrees to notify the water users at least once every three months, or more frequently if determined by the Authority, that the water system is not in compliance;

(e) A compliance schedule is submitted which outlines how the water supplier intends to achieve compliance, and the water supplier agrees to review this schedule once every three years to determine whether changes have occurred in the conditions which formed the basis for the schedule; and

(f) A plan is submitted which outlines interim control measures including application of the best technology treatment technique to be implemented during the period that the variance is in effect.

(2) The Authority shall document all findings of its determinations and if the Authority prescribes a schedule requiring compliance with a contaminant level for which the variance is granted later than five years from the date of issuance of the variance the Authority shall:

(a) Document the rationale for the extended compliance schedule;

(b) Discuss the rationale for the extended compliance schedule in the required public notice and opportunity for public hearing; and

(c) Provide the shortest practicable time schedule feasible under the circumstances.

(3) Before denying a request for a variance, the Authority shall advise the water supplier of the reasons for the denial and shall give the supplier an opportunity to present additional information. If the additional information is not sufficient to justify granting the variance, the variance shall be denied.

(4) If the Authority determines that the variance should be granted, it shall announce its intention to either hold a public hearing in the affected area prior to granting the variance; or serve notice of intent to grant the variance either personally, or by registered or certified mail to all customers connected to the water system, or by publication in a newspaper in general circulation in the area. If no hearing is requested within 10 days of the date that notice is given, the Authority may grant the variance.

(5) When a variance has been granted, and a water supplier fails to meet the compliance schedule, or fails to implement the interim control measures, or fails to
undertake the monitoring required under the conditions of the variance, the Authority may initiate enforcement action authorized by these rules.

(6) Variances from the maximum contaminant levels for volatile organic chemicals, organic chemicals and inorganic chemicals shall be issued by the Authority as follows:

(a) The Authority shall require Community water systems and Non-Transient Non-Community water systems to install and/or use any treatment method identified in OAR 333-061-0050(4)(b)(B), (E) and (F) as a condition for granting a variance except as provided in subsection (6)(b) of this rule. If, after the system's installation of the treatment method, the system cannot meet the MCL, that system shall be eligible for a variance.

(b) If a system can demonstrate through comprehensive engineering assessments, which may include pilot plant studies, that the treatment methods identified in OAR 333-061-0050(4)(b)(B), (E) and (F) would only achieve an insignificant reduction in contaminants, the Authority may issue a schedule of compliance that requires the system being granted the variance to examine other treatment methods as a condition of obtaining the variance.

(c) If the Authority determines that a treatment method identified in subsection (6)(b) of this rule is technically feasible, the Authority may require the system to install and/or use that treatment method in connection with a compliance schedule. The Authority's determination shall be based upon studies by the system and other relevant information.

(d) The Authority may require a public water system to use bottled water, point-of-use devices, point-of-entry devices or other means as a condition of granting a variance to avoid an unreasonable risk to health.

(7) The variances from the maximum contaminant level for fluoride shall be granted by the Authority as follows:

(a) The Authority shall require a Community water system to install and/or use any treatment method identified in OAR 333-061-0050(4)(b)(C) as a condition for granting a variance unless the Authority determines that such treatment method is not available and effective for fluoride control for the system. A treatment method shall not be considered to be "available and effective" for an individual system if the treatment method would not be technically appropriate and technically feasible for that system. If, upon application by a system for a variance, the Authority determines that none of the treatment methods identified in OAR 333-061-0050(4)(b)(C) are available and effective for the system, that system shall be entitled to a variance. The Authority's determination as to the availability and effectiveness of such treatment methods shall be based upon studies by the system and other relevant information. If a system submits information to demonstrate that a treatment method is not available and effective for fluoride control for that system, the Authority shall make a finding whether this information supports a decision that such treatment method is not
available and effective for that system before requiring installation and/or use of such treatment method.

(b) The Authority shall issue a schedule of compliance that may require the system being granted the variance to examine the following treatment methods to determine the probability that any of the following methods will significantly reduce the level of fluoride for that system, and if such probability exists, to determine whether any of these methods are technically feasible and economically reasonable, and that the fluoride reductions obtained will be commensurate with the costs incurred with the installation and use of such treatment methods for that system: Modification of lime softening; Alum coagulation; Electrodialysis; Anion exchange resins; Well field management; Alternate source; or Regionalization.

(c) If the Authority determines that a treatment method identified in subsection (6)(b) of this rule or any other treatment method is technically feasible, economically reasonable, and will achieve fluoride reductions commensurate with the costs incurred with the installation and/or use of such treatment method for the system, the Authority shall require the system to install and/or use that treatment method in connection with a compliance schedule. The Authority's determination shall be based upon studies by the system and other relevant information.

(8) Public water systems that use bottled water as a condition for receiving a variance must meet the following requirements.

(a) The public water system must develop and put in place a monitoring program approved by the Authority that provides reasonable assurances that the bottled water meets all MCLs. The public water system must monitor a representative sample of the bottled water for all applicable contaminants under OAR 333-061-0036 the first quarter that it supplies the bottled water to the public, and annually thereafter. Results of the monitoring program shall be provided to the Authority annually.

(b) As an alternative to subsection (7)(a) of this rule, the public water system must receive a certification from the bottled water company that the bottled water supplied has been taken from an "approved source" as defined in 21 CFR 129.3(a); the bottled water company has conducted monitoring in accordance with 21 CFR 129.80(g)(1) through (3); and the bottled water does not exceed any MCLs or quality limits as set out in 21 CFR 103.35, 110, and 129. The public water system shall provide the certification to the Authority the first quarter after it supplies bottled water and annually thereafter.

(c) The public water system is fully responsible for the provision of sufficient quantities of bottled water to every person supplied by the public water system, via door-to-door bottled water delivery.

(9) Public water systems that use point-of-use devices as a condition for obtaining a variance must meet the following requirements:
(a) It is the responsibility of the public water system to operate and maintain the point-of-use treatment system.

(b) The public water system must develop a monitoring plan and obtain Authority approval for the plan before point-of-use devices are installed for compliance. This monitoring plan must provide health protection equivalent to a monitoring plan for central water treatment.

(c) Effective technology must be properly applied under a plan approved by the Authority and the microbiological safety of the water must be maintained.

(d) The water system must submit adequate certification of performance, field testing and, if not included in the certification process, a rigorous engineering design review to the Authority for approval prior to installation.

(e) The design and application of the point-of-use devices must consider the tendency for increase in heterotrophic bacteria concentrations in water treated with activated carbon. It may be necessary to use frequent backwashing, post-contractor disinfection, and Heterotrophic Plate Count monitoring to ensure that the microbiological safety of the water is not compromised.

(f) All consumers shall be protected. Every building connected to the system must have a point-of-use device installed, maintained, and adequately monitored. The Authority must be assured that every building is subject to treatment and monitoring, and that the rights and responsibilities of the public water system customer convey with title upon sale of property.

(10) Public water systems shall not use bottled water to achieve compliance with an MCL. Bottled water or point-of-use devices may be used on a temporary basis to avoid an unreasonable risk to health.

(11) The Authority may grant a variance from the requirements of OAR 333-061-0030(4) "Microbiological Contaminants" for any system that demonstrates to the satisfaction of the Authority that violations of the total coliform MCL are due to persistent growth of total coliform in the distribution system rather than fecal or pathogenic contamination, a treatment lapse or deficiency, or a problem in the operation or maintenance of the distribution system. This demonstration, made by the system in writing and submitted to the Authority for review, shall show that the system meets the following conditions:

(a) The system meets treatment level requirements of OAR 333-061-0032,

(b) The system shows no occurrence of coliforms at the entry point to the distribution system,

(c) The system meets the turbidity MCL,

(d) The system maintains a detectable disinfectant residual in the distribution system,

(e) The system has no history of waterborne disease outbreaks using the current treatment and source configuration,

(f) The system maintains regular contact with the Authority to assess possible illness outbreaks,
(g) The system complies with coliform monitoring requirements and shows no occurrence of *E. coli* positive samples during the previous six months,

(h) The system has addressed requirements and recommendations of the previous sanitary survey conducted by the Authority,

(i) The system fully complies with cross connection control program requirements contained in OAR 333-061-0070,

(j) The system agrees to submit a biofilm control plan to the Authority within 12 months of the granting of the first request for a variance,

(k) The system monitors heterotrophic plate count weekly in conjunction with routine coliform sample collection and maintains HPC counts at levels less than 500 colonies per ml at any point where the disinfectant residual is less than 0.2 mg/l, and

(l) The system has a microbiological contaminant sampling plan approved by the Authority.

(12) The Authority is not permitted to issue any variances to the requirements of OAR 333-061-0030(3) and (4), OAR 333-061-0032, or OAR 333-061-0034 except as provided by section (13) of this rule. The Authority is also not permitted to issue any variances to the requirements of OAR 333-061-0036 pertaining to the treatment of surface water and groundwater under the direct influence of surface water. In addition, no permits will be granted for OAR 333-061-0030(4), OAR 333-061-0032(3)(c) or OAR 333-061-0032(5)(b).

(13) The Authority may grant variances from the standards specified in OAR 333-061-0032(3)(e) through (g) requiring the use of a specified water treatment technique if the Authority determines that the use of a specified water treatment technique is not necessary to protect public health based on the nature of the raw water source for a public water system. A variance granted under this section shall be conditioned on such monitoring and other requirements as the Administrator of the U.S. Environmental Protection Agency or the Director of the Oregon Health Authority may prescribe.

Stat. Auth.: ORS 448.131
Stats. Implemented: ORS 448.115, 448.135
